Periodic Monitoring Report for Mortandad Watershed, October 19–November 8, 2006; February 26–March 18, 2007; and June 4–June 24, 2007

Prepared by Environmental Programs Directorate

Los Alamos National Laboratory, operated by Los Alamos National Security, LLC, for the U.S. Department of Energy under Contract No. DE-AC52-06NA25396, has prepared this document pursuant to the Compliance Order on Consent, signed March 1, 2005. The Compliance Order on Consent contains requirements for the investigation and cleanup, including corrective action, of contamination at Los Alamos National Laboratory.

EXECUTIVE SUMMARY

The purpose of this report is to provide the results of three periodic monitoring events (PMEs) conducted by Los Alamos National Laboratory in the Mortandad Watershed. These PMEs for Mortandad Watershed were conducted pursuant to the 2006 "Interim Facility-Wide Groundwater Monitoring Plan," prepared under the March 1, 2005, Compliance Order on Consent (Consent Order).

The three PMEs documented in this report occurred from October 19 to November 8, 2006; February 26 to March 18, 2007; and June 4 to June 24, 2007. These events included the sampling of groundwater wells or well ports, springs, and base-flow stations.

Water samples obtained from various locations during these PMEs were analyzed for target analyte list metals, volatile organic compounds, cyanide, semivolatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls, high explosives radionuclides, low-level tritium, general inorganics, perchlorate, stable isotopes, and field parameters (alkalinity, dissolved oxygen, iron, pH, specific conductance, temperature, and turbidity).

The results from the three PMEs included in this report are summarized for each sampling event as follows.

October 19–November 8, 2006, PME

Six analytes measured in surface-water samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

Aluminum was detected at surface-water stations in Mortandad below Effluent Canyon, M-1E, E-1FW, E-1E, M-1W, M-2E, and TS-2E at concentrations above the New Mexico aquatic chronic (100 mg) standard.

One dioxin/furan compound was detected in surface water above a regulatory standard: at E-1W, tetrachlorodibenzodioxin[2,3,7,8-] was measured above the New Mexico human health criterion of 5.1×10^{-8} µg/L. Also at this location, bis(2-chloroethyl)ether was measured above of the New Mexico human health criterion of 5.3 µg/L.

Perchlorate was detected above the 4 µg/L screening level at 14.5 µg/L at surface-water station M-2E.

Twenty-six analytes measured in groundwater samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

Aluminum, iron, and manganese were the primary metals detected in alluvial and intermediate groundwater samples. A filtered groundwater sample collected from regional aquifer well R-28 contained chromium at 310 µg/L, which exceeds the New Mexico Water Quality Control Commission (NMWQCC) groundwater standard of 50 µg/L.

Chloride, fluoride, nitrate (as nitrogen), and total dissolved solids (TDS) were detected above NMWQCC groundwater standards in alluvial and intermediate monitoring wells.

Perchlorate was detected above the Consent Order screening level of 4 µg/L at monitoring wells MCO-4B, MCO-5, MCO-6, MCA-2, MCO-7, MCO-7.5, MT-3, MCOI-5, MCOI-6, and R-15.

February 26–March 18, 2007, PME

Three analytes measured in surface-water samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

The filtered aluminum concentrations at surface-water locations in Mortandad below Effluent Canyon and M-1E were 8.2 and 12.1 times the New Mexico aquatic life acute standard of 750 µg/L, which applies in this ephemeral reach.

The copper concentration at TS-2E was 61% of the New Mexico aquatic life acute standard (at 100 mg hardness) of 13.4 µg/L, which applies in this ephemeral reach. The zinc concentrations at E-1FW and M-1W were 58% and 147% of the New Mexico aquatic life acute standard (at 100 mg hardness) of 117.2 µg/L.

Twenty-six analytes measured in groundwater samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

The filtered iron and manganese concentrations at MCO-0.6 were 15.1 and 18.5 times, respectively, of the NMWQCC groundwater standards of 1000 µg/L and 200 µg/L. The filtered aluminum and iron concentrations at MCA-1 were 137% and 372%, respectively, of the NMWQCC groundwater standards of 5000 µg/L and 1000 µg/L. At MCO-7, the unfiltered mercury concentration was 245% of the 2 µg/L U.S. Environmental Protection Agency (EPA) maximum contaminant level (MCL) and NMWQCC groundwater standards.

The filtered iron and manganese concentrations at intermediate well MCOI-8 were 113% and 499%, respectively, of the NMWQCC groundwater standards of 1000 µg/L and 200 µg/L.

The chromium concentration in regional well R-28 was 892% of the NMWQCC groundwater standard of 50 µg/L.

Several organic compounds were found in groundwater and quality control (QC) samples with a few found near or above standards or screening levels. Four SVOCs were detected in alluvial groundwater at CDBO-6. Chrysene was detected at 156% of the 0.2 µg/L EPA MCL for drinking water.

Other compounds found near or above standards or screening levels included dioxane[1,4-] and bis(2-ethylhexyl)phthalate in intermediate groundwater. Bis(2-ethylhexyl)phthalate was detected at MCOI-6 at 150% of the 6 µg/L EPA MCL for drinking water.

The chloride concentration at alluvial well MCO-0.6 was 151% of the 250 mg/L NMWQCC groundwater standard.

The nitrate (as nitrogen) concentrations in three intermediate wells ranged up to 169% of the 10 mg/L New Mexico groundwater standard.

At Pine Rock Spring, nitrate (as nitrogen) was 144% of the 10 mg/L New Mexico groundwater standard.

Groundwater perchlorate concentrations at alluvial locations ranged from 0.08 µg/L to 30.5 µg/L. Concentrations at intermediate and regional aquifer wells ranged from 1.6 µg/L to 162 µg/L and from 0.13 µg/L to 6.9 µg/L, respectively.

June 4–June 24, 2007, PME

The filtered aluminum concentration at surface-water location M-1W was 7 times the New Mexico aquatic life acute standard at (100 mg hardness) of 750 µg/L, which applies to this ephemeral reach. The copper concentration at M-1E was 114%, and at M-1W it was 99% of the New Mexico aquatic life acute standard of 13.4 µg/L, which applies to this ephemeral reach.

DDT[4,4'-] was detected in the sample collected at E-1E at 16 times the New Mexico aquatic life chronic standard of 0.001 µg/L. Five other pesticide results for station E-1W (for DDT[4,4'-] two results), DDD[4,4'-], DDE[4,4'-], dieldrin, and heptachlor epoxide) were from 7 to 52 times their respective New Mexico human health criteria.

Eight analytes measured in surface-water samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

The filtered iron and manganese concentrations at MCO-0.6 were 26.5 and 22.5 times, respectively, of the NMWQCC groundwater standards of 1000 µg/L and 200 µg/L. The filtered aluminum and iron concentrations at MCO-2 were 188% and 563%, respectively, of the NMWQCC groundwater standards of 5000 µg/L and 1000 µg/L. The sample from MCO-2 also had unfiltered concentrations of beryllium and lead that were above their respective EPA MCL or screening values for drinking water.

The unfiltered lead concentration at regional well Test Well 8 was 3.4 times the EPA screening value for drinking water. The chromium concentration in regional well R-28 was 872% of the NMWQCC groundwater standard of 50 µg/L.

Several organic compounds were found in groundwater and QC samples with a few found near or above standards or screening levels, including dioxane[1,4-] and bis(2-ethylhexyl)phthalate in intermediate groundwater. Bis(2-ethylhexyl)phthalate was detected at MCOI-6 at 207% of the 6 µg/L EPA MCL for drinking water.

The chloride concentration at alluvial well MCO-0.6 was 142% of the 250 mg/L NMWQCC groundwater standard. The TDS concentration at MCO-0.6 was 103% of the 1000 mg/L NMWQCC groundwater standard. At six alluvial wells with fluoride concentrations above one-half the 1.6 mg/L NMWQCC groundwater standard, results ranged from 60% to 107% of the standard.

The nitrate (as nitrogen) concentrations in three intermediate wells ranged from 52% to 186% of the 10 mg/L NMWQCC groundwater standard.

Groundwater perchlorate concentrations at alluvial locations ranged from 0.4 µg/L up to 33 µg/L. Perchlorate concentrations at intermediate and regional aquifer wells ranged from 95 µg/L to 190 µg/L and from 0.18 µg/L to 7.4 µg/L, respectively.

Twenty-seven analytes measured in groundwater samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

1.0 INTRODUCTION

This report provides documentation of quarterly groundwater and surface-water monitoring conducted by Los Alamos National Laboratory (LANL or the Laboratory) in the Mortandad Watershed pursuant to the "Interim Facility-Wide Groundwater Monitoring Plan" (IFGMP) (LANL 2006, 094043), prepared under the March 1, 2005, Compliance Order on Consent (Consent Order). This report combines three periodic monitoring events (PMEs) that occurred between October 19 and November 8, 2006; February 26 and March 18, 2007; and June 4 and June 24, 2007. These events included sampling at groundwater wells or screens, springs, and base-flow stations.

This report presents the following information:

- General background information on the watershed
- The watershed conceptual model
- Field measurement monitoring results
- Water-quality monitoring results
- Results of the screening analysis (comparing these PME results with regulatory standards and results from previous reports)
- Conclusions drawn based on the data and the screening analysis

Information on radioactive materials and radionuclides, including the results of sampling and analysis of radioactive constituents, is voluntarily provided to the New Mexico Environment Department (NMED) in accordance with U.S. Department of Energy (DOE) policy.

1.1 Background

Mortandad Watershed is an east-to-southeast trending drainage that heads on the Pajarito Plateau near the main Laboratory complex at Technical Area (TA) 03 at an elevation of 7380 ft. The drainage extends about 9.6 mi from its headwaters to its confluence with the Rio Grande at an elevation of 5440 ft. The watershed crosses San Ildefonso Pueblo land for several miles before joining the Rio Grande.

Mortandad Watershed is located in the central portion of the Laboratory and covers approximately 10 mi^2. San Ildefonso Pueblo is directly adjacent to a portion of the Laboratory's eastern boundary and includes the eastern end of Mortandad Watershed. Mortandad Watershed contains several tributary canyons that have received contaminants released during historic Laboratory operations. The most prominent tributary canyons include Ten Site Canyon, Pratt Canyon, Effluent Canyon, and Cañada del Buey. Current and former technical areas located in Mortandad Watershed include TA-03, -04, -05, -18, -35, -42, -46, -48, - 50, -51, -52, -54, -55, and -59. The primary sources of contamination in this watershed are attributed to past releases of contaminants from outfalls and spills at TA-35 and TA-50, including the Radioactive Liquid Waste Treatment Facility (RLWTF) at TA-50. Metals and volatile organic compounds (VOCs) have historically been released into the canyon. Nitrate, perchlorate, fluoride, molybdenum, and radionuclides are some of the contaminants that have been detected in Mortandad Canyon alluvial groundwater. Perchlorate and nitrate contamination is present in the vadose zone beneath the portion of Mortandad below the confluence of Ten Site Canyon. Nitrate, perchlorate, chromium, and tritium are detected in intermediate perched groundwater. Chromium, nitrate, perchlorate, and tritium occur in the regional groundwater.

1.2 Conceptual Model

The conceptual model for the Mortandad Watershed provided in the IFGMP is reproduced in Table A-1 (Appendix A) of this document.

2.0 SCOPE OF ACTIVITIES

The PMEs for the Mortandad Watershed were conducted pursuant to the 2006 IFGMP.

Tables 2.0.1-1 through 2.0.1-3, provide the location name, sample collection date, port name, port depth, screened interval, top and bottom screen depths, base flow or water level, and the water-level method for each of the monitored locations. These locations are shown in Figure 2.0-1.

3.0 MONITORING RESULTS

3.1 Methods and Procedures

All methods and procedures used to perform the field activities associated with the PMEs are documented in the 2006 IFGMP.

3.2 Field Parameter Results

Tables B-1 through B-3 (Appendix B) contain the field parameter results for the PMEs and the three PMEs immediately before the October 2006 sampling event.

3.3 Water-Level Observations

The periodic monitoring water-level data for these events and the previous three monitoring events are presented in Table C-1 (Appendix C). For wells equipped with transducers, the reported water level is the water-level measurement taken earliest on the day of sampling. All manual measurements are reported immediately before sampling. The water-level measurements taken during these PMEs are shown graphically in Figures 3.3-1 through 3.3-3.

3.4 Deviations from Planned Scope

Tables 3.4-1 through 3.4-3 describe the deviations from the planned scope of the PMEs.

4.0 ANALYTICAL DATA RESULTS

4.1 Methods and Procedures

All methods and procedures used to perform the analytical activities of the PMEs are documented in the 2006 IFGMP.

4.2 Analytical Data

Appendix D presents the analytical data from the PMEs and from the three sampling events immediately before October 2006. The regulatory standards to which the results are compared are presented in Table 4.2-1. The analytical laboratory reports (including chains of custody, etc.) can be found in Appendix G.

Appendix D contains all data obtained during the PMEs (that is, all data that have been independently reviewed for conformance with Laboratory requirements), with the following constraints.

- All data
    - ❖ Data that are R qualified (rejected because of noncompliance regarding quality control [QC] acceptance criteria) during independent validation are considered "not detected" but are still reported. Analytical laboratory QC results including matrix spike and matrix spike duplicates are not included in the data set.
- Radionuclides
    - ❖ All low-detection-limit tritium data are reported. Results greater than 3 times the 1 standard deviation total propagated analytical uncertainty (or 3σ) are considered to be detections.
    - ❖ Americium-241 and uranium-235 are reported only by chemical separation alpha spectroscopy. No gamma spectroscopy results are presented for these analytes.
    - ❖ Only cesium-137, colbalt-60, neptunium-237, potassium-40, and sodium-22 are reported (or analyzed) for the gamma spectroscopy suite.
    - ❖ Otherwise, all detections are reported at all locations, that is, results without a laboratory qualifier of U or X (abbreviations that indicate that the analyte was not detected).
- Nonradionuclides
    - ❖ All results, excluding nondetects, are reported. Field duplicates, reanalyses, field blanks, trip blanks, equipment blanks, and different analytical methods are also reported.

The standards applied to all surface-water and groundwater data are listed in Table 4.2-1. Table 4.2-1 indicates the type of standard and the agency that promulgated the standard.

Data for PMRs are evaluated using the following screening process.

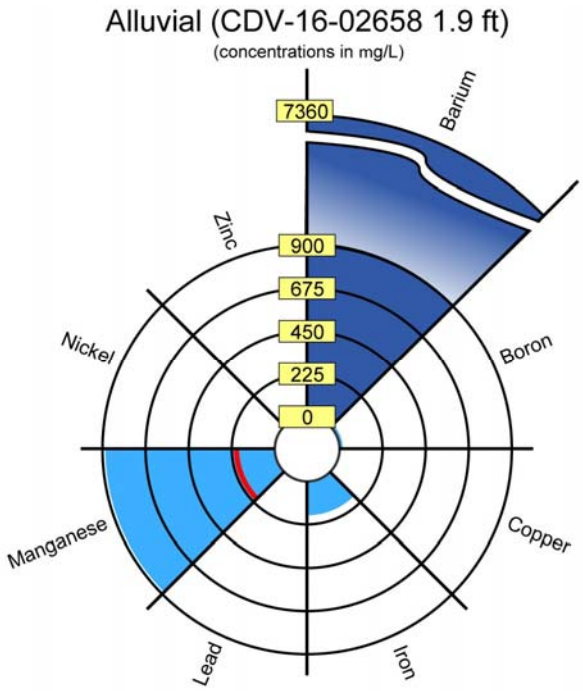
- Surface-water and groundwater perchlorate data were compared with the screening level of 4 µg/L established in Section VIII.A.1.a of the Consent Order. Surface-water sample results were compared with all surface-water standards without consideration of the designated use for the particular reach. The New Mexico Water Quality Control Commission (NMWQCC) groundwater standards apply to the dissolved (filtered) portion of specified contaminants; however, the standards for mercury, organic compounds, and nonaqueous phase liquids apply to the total unfiltered concentrations of the contaminants.

- As required by the Consent Order, U.S. Environmental Protection Agency (EPA) Region 6 tap water screening levels are used for constituents having no other regulatory standard and for which toxicological information is published. For these screening levels, the tables indicate a risk type of C (cancer) or N (noncancer). For the cancer risk type, the risk levels are for 10^{-6} excess cancer risk. The Consent Order specifies screening with these values at a risk level of 10^{-5} (rather than 10^{-6}) excess cancer risk. Therefore, data must exceed the 10^{-6} screening values by a factor of 10 or more to be above a risk level of 10^{-5} excess cancer risk.

- The analytical results for radioactivity are compared with DOE Biota Concentration Guides (BCGs) for surface water and Derived Concentration Guidelines (DCGs) for groundwater.

Tables in Appendix E show all values for perchlorate, radioactivity, organic compounds, and all values greater than half the lowest applicable standard for metals and general inorganic compounds.

Analytical results are presented graphically in Figures 4.2-1 through 4.2-3. Figures 4.2-1 through 4.2-3 contain diagrams displaying a series of select analytes around the circumference and showing the concentration by the length of the radius. An example of a diagram displaying metal concentrations is shown below.



Example of a diagram showing metal concentrations

The analytes displayed in Figures 4.2-1 through 4.2-3 were selected from data acquired during the PMEs. Diagrams are shown for both groundwater and surface-water data. Selected nonmetals are shown in green while metals are displayed in shades of blue. The analytes shown on the figures were chosen for display because of their historical presence in surface water and groundwater in this watershed.

Analytes that are not shown on the diagrams were either not detected, were radionuclides, or were present at concentrations below standards and screening levels. The solid red lines, when shown, depict applicable regulatory standards or screening levels. A break in the diagrams' scale may be shown for certain analytes whose concentrations are considerably greater than other measurements displayed on the figure. Note that some standards or screening levels may exceed the highest concentration displayed and may not appear on the diagram. Standards and screening-level values can be found in Tables E-1 through E-29 in Appendix E.

A summary of the results from comparing the surface-water analytical data with regulatory standards is shown in Tables E-1 through E-3, E-10 through E-14, and E-21 through E-24 (Appendix E). Graphical representations of select surface-water analytical results are shown in Figures 4.2-1 through 4.2-3.

A summary of the results comparing the groundwater analytical data with regulatory standards is presented in Tables E-4 through E-9, E-16 through E-20, and E-25 through E-29 (Appendix E). Graphical representations of select groundwater analytical results (section 4.2) are shown in Figures 4.2-1 through 4.2-3.

Tables 4.2.-1 through 4.2.-3 give the number of analytical results for surface water and groundwater (by hydrogeologic zone for a specific analytical suite) that are above a standard or screening level. Multiple detections of a particular constituent at a location are counted as one result. For example, if aluminum is detected above a standard or screening level in both a primary sample and a field duplicate, the detection is counted as one result.

4.2.1 Surface Water (Base Flow)

4.2.1.1 October 19–November 8, 2006, PME

Aluminum is the predominant metal present in surface water at concentrations above water-quality standards throughout all watersheds at the Laboratory. At five locations having values above one-half of the standard, the filtered aluminum concentrations ranged from 52% to 545% of the New Mexico aquatic life acute standard of 750 µg/L, which applies in this ephemeral reach. The filtered aluminum concentrations at seven locations were above the New Mexico aquatic life chronic standard of 87 µg/L; however, this standard does not apply to this stream segment because it is not perennial. The filtered lead concentration at M-1W was above the New Mexico aquatic life chronic standard (at 100 mg hardness) of 2.5 µg/L; this standard also does not apply in this reach.

Numerous detections of dioxin and furan compounds occurred in surface-water samples. Only one detected compound has a regulatory standard: at E-1W, tetrachlorodibenzodioxin[2,3,7,8-] was measured at 52 times the New Mexico human health criterion of 5.1×10^{-8} µg/L. Also at this location, bis(2 chloroethyl)ether was measured at 194% of the New Mexico human health criteria of 5.3 µg/L, and nitrosodimethylamine[N-] was measured at 34% of the New Mexico human health criterion of 30 µg/L.

With one exception, perchlorate concentrations in surface water at all sample locations were below 0.22 µg/L. The exception was at location M-2E, which had a result of 14.5 µg/L. The Consent Order screening level for perchlorate is 4 µg/L. No other general inorganic compound results for this PME exceeded regulatory standards.

No radionuclides exceeded screening criteria in surface-water samples.

4.2.1.2 February 26–March 18, 2007, PME

The filtered aluminum concentrations at locations in Mortandad below Effluent Canyon and M-1E were 8.2 and 12.1 times the New Mexico aquatic life acute standard of 750 µg/L, which applies in this ephemeral reach. The filtered aluminum concentrations at five locations were above the New Mexico aquatic life chronic standard of 87 µg/L; however, this standard does not apply to this stream segment because it is not perennial.

Results for filtered cadmium, copper, and lead were also near or above the New Mexico aquatic life chronic standards (at 100 mg hardness); however, these standards do not apply to this stream segment because it is not perennial. The copper concentration at TS-2E was 61% of the New Mexico aquatic life acute standard (at 100 mg hardness) of 13.4 µg/L, which applies in this ephemeral reach. The zinc concentrations at E-1FW and M-1W were 58% and 147% of the New Mexico aquatic life acute standard (at 100 mg hardness) of 117.2 µg/L.

Numerous detections of dioxin and furan compounds occurred in surface-water samples. None of the detected compounds have an applicable regulatory standard or screening level. Several other organic compounds were detected in samples, but none were found at levels near an applicable regulatory standard or screening level.

Perchlorate concentrations in surface water at all sample locations were below the 4 µg/L Consent Order screening level. No other general inorganic compound results for this PME exceeded regulatory standards.

Tritium was detected at seven surface-water locations at activities below 200 pCi/L.

4.2.1.3 June 4–June 24, 2007, PME

The filtered aluminum concentration at location M-1W was 7 times the New Mexico aquatic life acute standard (at 100 mg hardness) of 750 µg/L, which applies to this ephemeral reach. The filtered aluminum concentrations at three locations were above the New Mexico aquatic life chronic standard (at 100 mg hardness) of 87 µg/L; however, this standard does not apply to this stream segment because it is not perennial.

The copper concentration at M-1E was 114% and at M-1W was 99% of the New Mexico aquatic life acute standard (at 100 mg hardness) of 13.4 µg/L, which applies in this ephemeral reach. Results for filtered copper and lead in two other samples were also near or above the New Mexico aquatic life chronic standards (at 100 mg hardness); however, these standards do not apply to this stream segment because it is not perennial.

Numerous detections of dioxin and furan compounds occurred in surface-water samples. None of the detected compounds have an applicable regulatory standard or screening level. At E-1W, 10 pesticide compounds were found but only in one of two duplicate samples. Compounds found at the highest levels relative to regulatory standards were endosulfan II at 22% and endrin at 48% of the respective 0.22 µg/L and 0.086 µg/L New Mexico aquatic life acute standards. DDT[4,4'-] was also detected in the sample at E-1E. Six of the pesticide results (for DDT[4,4'-] (two results), DDD[4,4'-], DDE[4,4'-], dieldrin, and heptachlor epoxide) were from 7 to 52 times their respective New Mexico human health criteria. Toluene was detected in two samples but not at levels near an applicable regulatory standard or screening level.

Perchlorate concentrations in surface water measured at the two sample locations were below the Consent Order screening level of 4 µg/L. No other general inorganic compound results for this PME exceeded regulatory standards.

Tritium was detected at three surface-water locations at activities below 280 pCi/L.

4.2.2 Groundwater

4.2.2.1 October 19–November 8, 2006, PME

The filtered cobalt, iron, and manganese concentrations at MCO-0.6 were 51%, 162%, and 2935%, respectively, of the New Mexico groundwater standards for irrigation use (cobalt) and domestic water supply (iron, manganese). The filtered aluminum and iron concentrations at MCA-1 were 116% and 310%, respectively, of the New Mexico groundwater standards for irrigation use (aluminum) and domestic water supply (iron). The filtered arsenic concentration in this well was 63% of the 10 µg/L EPA maximum contaminant level (MCL) for drinking water and 6.3% of the 100 µg/L NMWQCC groundwater standard.

The filtered iron and manganese concentrations at intermediate well MCOI-8 were 80% and 477%, respectively, of the NMWQCC groundwater standards of 1000 µg/L and 200 µg/L. The unfiltered chromium concentration in this well was 396% of the 100 µg/L EPA MCL for drinking water. The filtered chromium concentration in MCOI-6 was 83% of the NMWQCC groundwater standard of 50 µg/L.

The filtered arsenic concentration in regional well R-14 at 1204 ft was 66% of the 10 µg/L EPA MCL for drinking water and 6.6% of the 100 µg/L NMWQCC groundwater standard. The chromium concentration in regional well R-28 was 620% of the NMWQCC groundwater standard of 50 µg/L.

Numerous detections of dioxin and furan compounds occurred in groundwater samples. Only one compound has a regulatory standard or screening level: at MT-3, tetrachlorodibenzodioxin[2,3,7,8-] was measured at 19% of the EPA tap water 10^{-5} excess cancer risk screening level of 4.48×10^{-6} µg/L.

Several other organic compounds were found in groundwater and QC samples. Compounds found near or above standards or screening levels included dioxane[1,4-] and bis(2-ethylhexyl)phthalate. Dioxane[1,4-] was detected (based on the semivolatile method, which is more precise than the volatile method) at MCOI-5 and MCOI-6 at 13% and 40%, respectively, of the EPA tap water 10^{-5} excess cancer risk screening level of 61.1 µg/L. Bis(2-ethylhexyl)phthalate was detected at MCOI-6 at 158% of the 6 µg/L EPA MCL for drinking water.

The chloride concentration at alluvial well MCO-0.6 was 180% of the 250 mg/L New Mexico groundwater standard. The total dissolved solids (TDS) concentration at MCO-0.6 was 117% of the 1000 mg/L New Mexico groundwater standard.

Fluoride was present in alluvial wells at concentrations that ranged from 60% up to 109% of the 1.6 mg/L New Mexico groundwater standard. Nitrate (as nitrogen) concentrations in intermediate wells ranged from 51% up to 187% of the 10 mg/L New Mexico groundwater standard.

At Pine Rock Spring on San Ildefonso Pueblo, fed by intermediate groundwater, the fluoride concentration was 56% of the 1.6 mg/L New Mexico groundwater standard. The TDS concentration at this location was 55% of the 1000 mg/L New Mexico groundwater standard.

Uranium was detected in filtered samples at MCO-0.6 at 29% and Pine Rock Spring at 109% of the NMWQCC groundwater standard of 30 µg/L. Tritium was detected at MCOI-4, MCOI-5, and MCOI-6 at 63%, 27%, and 58%, respectively, of the 20,000 pCi/L EPA MCL for drinking water.

Groundwater perchlorate concentrations at alluvial locations ranged from nondetection up to 30 µg/L. Concentrations at intermediate and regional aquifer wells ranged from nondetection up to 188 µg/L and 6.7 µg/L respectively. The Consent Order screening level for perchorate is 4 µg/L, and the EPA drinking water equivalent level is 24.5 µg/L.

The tritium activity at Pine Rock Spring was 30 pCi/L. For regional aquifer monitoring wells, tritium activities were mostly not detected but were 30 pCi/L at R-15 and 195 pCi/L at R-28.

4.2.2.2 February 26–March 18, 2007, PME

The filtered iron and manganese concentrations at MCO-0.6 were 15.1 and 18.5 times, respectively, the NMWQCC groundwater standards of 1000 µg/L and 200 µg/L. The filtered aluminum and iron concentrations at MCA-1 were 137% and 372%, respectively, of the NMWQCC groundwater standards of 5000 µg/L and 1000 µg/L. At MCO-7 the unfiltered mercury concentration was 245% of the 2 µg/L EPA MCL and NMWQCC groundwater standards.

The filtered iron and manganese concentrations at intermediate well MCOI-8 were 113% and 499%, respectively, of the NMWQCC groundwater standards of 1000 µg/L and 200 µg/L. The filtered chromium concentration in MCOI-6 was 61% of the New Mexico groundwater standard of 50 µg/L.

The chromium concentration in regional well R-28 was 892% of the NMWQCC groundwater standard of 50 µg/L.

Several organic compounds were found in groundwater and QC samples with a few found near or above standards or screening levels. Four SVOCs were detected in alluvial groundwater at CDBO-6. Of these, the concentration of benzo(b)fluoranthene was 73% of the EPA tap water 10^{-5} excess cancer risk screening level of 0.295 µg/L, and the concentration of chrysene was at 156% of the 0.2 µg/L EPA MCL for drinking water.

Other compounds found near or above standards or screening levels included dioxane[1,4-] and bis(2 ethylhexyl)phthalate in intermediate groundwater. Dioxane[1,4-] was detected (based on the semivolatile method, which is more precise than the volatile method) at MCOI-4 and MCOI-6 at 45% and 41%, respectively, of the EPA tap water 10^{-5} excess cancer risk screening level of 61.1 µg/L. Bis(2 ethylhexyl)phthalate was detected at MCOI-6 at 150% of the 6 µg/L EPA MCL for drinking water.

The polychlorinated biphenyl (PCB) Aroclor-1242 was detected at 0.15 µg/L in a sample from regional well R-1.

The chloride concentration at alluvial well MCO-0.6 was 151% of the 250 mg/L NMWQCC groundwater standard (for domestic water supply). The TDS concentrations at MCO-0.6 and MCO-3 were 95% and 73%, respectively, of the 1000 mg/L NMWQCC groundwater standard.

At alluvial wells with fluoride concentrations above one-half the 1.6 mg/L NMWQCC groundwater standard, results ranged from 59% to 85% of the standard. The nitrate (as nitrogen) concentrations in three intermediate wells ranged up to 169% of the 10 mg/L New Mexico groundwater standard, with several others above 54% of the standard. The nitrate (as nitrogen) concentration at regional well R-28 was 50% of the 10 mg/L New Mexico groundwater standard.

At Pine Rock Spring on San Ildefonso Pueblo, fed by intermediate groundwater, the fluoride concentration was 56% of the 1.6 mg/L NMWQCC groundwater standard, and nitrate (as nitrogen) was 144% of the 10 mg/L New Mexico groundwater standard. The TDS concentration was 56% of the 1000 mg/L NMWQCC groundwater standard (for domestic water supply).

Uranium was detected in filtered samples at MCO-0.6 at 17% and Pine Rock Spring at 94% of the NMWQCC groundwater standard of 30 µg/L. Tritium activities in alluvial wells ranged from 70 pCi/L to 1780 pCi/L. Tritium was detected at MCOI-4, MCOI-5, and MCOI-6 at 56%, 20%, and 57%, respectively, of the 20,000 pCi/L EPA MCL for drinking water.

Groundwater perchlorate concentrations at alluvial locations ranged from 0.08 µg/L up to 30.5 µg/L. Concentrations at intermediate and regional aquifer wells ranged from 1.6 µg/L to 162 µg/L and from 0.13 µg/L to 6.9 µg/L, respectively.

The tritium activity at Pine Rock Spring was 29 pCi/L. For regional aquifer monitoring wells, tritium activities were mainly nondetections but were 36 pCi/L at Test Well 8, 28 pCi/L at R-15, and 192 pCi/L at R-28.

4.2.2.3 June 4–June 24, 2007, PME

The filtered iron and manganese concentrations at MCO-0.6 were 26.5 and 22.5 times, respectively, the NMWQCC groundwater standards of 1000 µg/L and 200 µg/L. The filtered arsenic concentration in this well was 63% of the 10 µg/L EPA MCL for drinking water and 6.3% of the NMWQCC groundwater standard. The filtered aluminum, iron, and manganese concentrations at MCO-2 were 188%, 563%, and 91%, respectively, of the NMWQCC groundwater standards of 5000 µg/L, 1000 µg/L, and 200 µg/L. The filtered arsenic concentration in this well was 55% of the 10 µg/L EPA MCL for drinking water, and the filtered chromium concentration was 84% of the 50 µg/L New Mexico groundwater standard. The sample

from MCO-2 also had unfiltered concentrations of beryllium and lead that were above their respective EPA MCL or screening values for drinking water. The filtered iron concentration at MCA-1 was 77% of the NMWQCC groundwater standard of 1000 µg/L.

The filtered chromium concentration in MCOI-6 was 60% of the NMWQCC groundwater standard of 50 µg/L. The unfiltered lead concentration at regional well Test Well 8 was 3.4 times the EPA screening value for drinking water. The chromium concentration in regional well R-28 was 872% of the NMWQCC groundwater standard of 50 µg/L.

Several organic compounds were found in groundwater and QC samples with a few found near or above standards or screening levels, including dioxane[1,4-] and bis(2-ethylhexyl)phthalate in intermediate groundwater. Dioxane[1,4-] was detected (based on the semivolatile method, which is more precise than the volatile method) at MCOI-4 and MCOI-6 at 48% and 40%, respectively, of the EPA tap water 10^{-5} excess cancer risk screening level of 61.1 µg/L. Bis(2-ethylhexyl)phthalate was detected at MCOI-6 at 207% of the 6 µg/L EPA MCL for drinking water.

Three pesticide compounds were detected in a sample from regional aquifer well R-1: DDT[4,4'-], DDD[4,4'-], and DDE[4,4'-].

The chloride concentration at alluvial well MCO-0.6 was 142% of the 250 mg/L NMWQCC groundwater standard. The TDS concentrations at MCO-0.6 and MCO-2 were 103% and 55% of the 1000 mg/L NMWQCC groundwater standard (for domestic water supply). At six alluvial wells with fluoride concentrations above one-half the 1.6 mg/L NMWQCC groundwater standard, results ranged from 60% to 107% of the standard.

The nitrate (as nitrogen) concentrations in three intermediate wells ranged from 52% to 186% of the 10 mg/L NMWQCC groundwater standard. The nitrate (as nitrogen) concentration at regional well R-28 was 54% of the 10 mg/L NMWQCC groundwater standard.

Uranium was detected in filtered samples at MCO-0.6 at 30% and MCO-2 at 21% of the NMWQCC groundwater standard of 30 µg/L. Tritium activities in 10 alluvial wells ranged from 32 pCi/L to 1500 pCi/L. Tritium was detected at MCOI-4, MCOI-5, and MCOI-6 at 57%, 18%, and 68%, respectively, of the 20,000 pCi/L EPA MCL for drinking water.

Groundwater perchlorate concentrations at alluvial locations ranged from 0.4 µg/L to 33 µg/L. Concentrations at intermediate and regional aquifer wells ranged from 95 µg/L to 190 µg/L and 0.18 µg/L to 7.4 µg/L, respectively.

4.3 Sampling Program Modifications

No modifications to the periodic monitoring sampling for the Mortandad Watershed are proposed at this time.

5.0 INVESTIGATION-DERIVED WASTE

Appendix F discusses the management of wastes produced during the PMEs and contains the waste management records for waste streams generated during these sampling events.

6.0 SUMMARY AND INTERPRETATIONS

6.1 Monitoring Results

An evaluation of the field parameter monitoring results presented in Tables B-1 through B-3 (Appendix B), and results of subsequent monitoring events will be provided in the annual update to the IFGMP.

6.2 Analytical Results

6.2.1 Surface Water (Base Flow)

The types of contaminants detected in surface water and their concentrations are consistent between sampling events for these PMEs and also with previous data. Table 6.2-1 through 6.2-3 present the number of analytes above standards or screening levels for groundwater and surface water.

6.2.1.1 October 19–November 8, 2006, PME

Six analytes measured in surface-water samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

The filtered aluminum concentrations at seven locations were above the New Mexico aquatic life chronic standard of 87 µg/L; however, this standard does not apply to this stream segment because it is not perennial. The filtered lead concentration at M-1W was above the New Mexico aquatic life chronic standard (at 100 mg hardness) of 2.5 µg/L; this standard also does not apply in this reach.

Several dioxin/furan and semivolatile compound results were rejected in secondary validation due to analytical laboratory QC failures.

6.2.1.2 February 26–March 18, 2007, PME

Three analytes (aluminum, cadmium, zinc) measured in surface-water samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

The filtered aluminum concentrations at five locations were above the New Mexico aquatic life chronic standard of 87 µg/L; however, this standard does not apply to this stream segment because it is not perennial.

Results for filtered cadmium, copper, and lead were also near or above the New Mexico aquatic life chronic standards (at 100 mg hardness); however, these standards do not apply to this stream segment because it is not perennial.

6.2.1.3 June 4–June 24, 2007, PME

Eight analytes measured in surface-water samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

The filtered aluminum concentrations at three locations were above the New Mexico aquatic life chronic standard of 87 µg/L; however, this standard does not apply to this stream segment because it is not perennial.

Results for filtered copper and lead in two other samples were also near or above the New Mexico aquatic life chronic standards (at 100 mg hardness); however, these standards do not apply to this stream segment because it is not perennial.

6.2.2 Groundwater

The predominant metals present in groundwater during the three PMEs (particularly in unfiltered spring samples) at concentrations above water-quality standards are aluminum, manganese, and iron. The types of contaminants detected in groundwater and their concentrations are consistent among sampling events for these PMEs and also with previous data.

6.2.2.1 October 19–November 8, 2006, PME

Twenty-six analytes measured in groundwater samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

At MT-3, tetrachlorodibenzodioxin[2,3,7,8-] was measured at 19% of the EPA tap water 10^{-5} excess cancer risk screening level of 4.48×10^{-6} µg/L. This result, however, was rejected in a secondary validation due to an analytical laboratory QC failure.

Several organic compounds were found in groundwater and QC samples.

6.2.2.2 February 26–March 18, 2007, PME

Twenty-six analytes measured in groundwater samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

Several organic compounds were found in groundwater and QC samples with a few found near or above standards or screening levels. Four SVOCs were detected in alluvial groundwater at CDBO-6 but were not found in a field duplicate. Of these, the concentration of benzo(b)fluoranthene was 73% of the EPA tap water 10^{-5} excess cancer risk screening level of 0.295 µg/L, and the concentration of chrysene was at 156% of the 0.2 µg/L EPA MCL for drinking water.

The PCB aroclor-1242 was detected in a sample from regional well R-1, but the result was rejected in a secondary validation due to an analytical laboratory QC failure.

6.2.2.3 June 4–June 24, 2007, PME

Twenty-seven analytes measured in groundwater samples collected during this PME from Mortandad Canyon exceeded regulatory standards or screening levels.

Several organic compounds were found in groundwater and QC samples with a few found near or above standards or screening levels, including dioxane[1,4-] and bis(2-ethylhexyl)phthalate in intermediate groundwater. Bis(2-ethylhexyl)phthalate was detected at MCOI-6 at 207% of the 6 µg/L EPA MCL for drinking water.

Three pesticide compounds were detected in a sample from regional aquifer well R-1: DDT[4,4'-], DDD[4,4'-], and DDE[4,4'-], but they were not detected in a field duplicate sample.

6.3 Data Gaps

A summary of the field parameter gaps encountered during the PMEs may be found in Tables 3.4-1 through 3.4-3. The tables provide a detailed account of sampling event deviations.

7.0 REFERENCES

The following list includes all documents cited in this report. Parenthetical information following each reference provides the author(s), publication date, and ER ID number. This information is also included in text citations. ER ID numbers are assigned by the Environmental Programs Directorate's Records Processing Facility (RPF) and are used to locate the document at the RPF and, where applicable, in the master reference set.

Copies of the master reference set are maintained at the NMED Hazardous Waste Bureau; the U.S. Department of Energy–Los Alamos Site Office; the U.S. Environmental Protection Agency, Region 6; and the Directorate. The set was developed to ensure that the administrative authority has all material needed to review this document, and it is updated with every document submitted to the administrative authority. Documents previously submitted to the administrative authority are not included.

Table 3.4-1
Observations and Deviations
October 19–November 8, 2006, PME

Location	Deviation	Cause	Comment
CDBO-1, -2, -3	No data are included in this report for these locations.	The locations could not be sampled on 09/27/06 because they were dry.	Locations will be checked again during next scheduled sampling round.
CDBO-1, -2, -3, -4, -5, -7, -8, -9	No data are included in this report for these locations.	The locations could not be sampled on 10/02/06 because they were dry.	Locations will be checked again during next scheduled sampling round.
MCA-5, MCO-2	No data are included in this report for these locations.	The locations could not be sampled on 10/26/06 because they were dry.	Locations will be checked again during next scheduled sampling round.
MCOBT-4.4	No data are included in this report for this location.	The location could not be sampled on 10/19/06 because of a broken well pump.	Location will be sampled after well maintenance.
MCOI-8	Limited suite data are included in this report for this location.	On 10/20/06 there was insufficient water to collect full analytical suite.	Location will be checked again during next scheduled sampling round.
MT-2, MT-4	No data are included in this report for these locations.	MT-3 was sampled on 10/26/06. Only one location of MT-2, MT-3, and MT-4 needs to be sampled.	None
TSCA-6, TSWB-6	No data are included in this report for these locations.	The locations could not be sampled on 09/26/06 because they were dry.	Locations will be checked again during next scheduled sampling round.

Table 3.4-2
Observations and Deviations
February 26–March 18, 2007

Location	Deviation	Cause	Comments
CDBO-1, -2, -3, -4, -5, -7, -8, -9	No data are included in this report for these locations.	The locations could not be sampled on 02/22/07 because they were dry.	Locations will be checked again during next scheduled sampling round.
M-2E	No data are included in this report for this location.	The location could not be sampled on 02/27/07 because it was frozen with no flow.	Location will be checked again during next scheduled sampling round.
MCA-5	No data are included in this report for this location.	The location could not be sampled on 03/08/07 because it was dry.	Location will be checked again during next scheduled sampling round.
MCO-2	No data are included in this report for this location.	The location could not be sampled on 03/06/07 because it was frozen with no flow.	Location will be checked again during next scheduled sampling round.
MCOBT-4.4	No data are included in this report for this location.	The location could not be sampled on 03/12/07 because it was dry.	Location will be checked again during next scheduled sampling round.
MCOI-8	No data are included in this report for this location.	The location could not be sampled on 02/27/07 because it was dry.	Location will be checked again during next scheduled sampling round.
MT-2, MT-3	No data are included in this report for these locations.	MT-4 was sampled on 3/13/07. Only one location of MT-2, MT-3, and MT-4 needs to be sampled.	None
TS-1W	No data are included in this report for this location.	The location could not be sampled on 03/05/07 because it was dry.	Location will be checked again during next scheduled sampling round.
TSCA-6, TSWB-6	No data are included in this report for these locations.	These locations could not be sampled on 03/7/07 because they were dry.	Locations will be checked again during next scheduled sampling round.

Table 3.4-3
Observations and Deviations
June 4–June 24, 2007, PME

Location	Deviation	Cause	Comments
CDBO-1,2,3,4,5,6,7, TS-1W	No data are included in this report for these locations**.**	The locations could not be sampled on 06/11/07 because they were dry.	Locations will be checked again during next scheduled sampling round.
CDBO-8,9, MCOBT-4,4, MCOI-8	No data are included in this report for these locations.	The locations could not be sampled on 06/08/07 because they were dry.	Locations will be checked again during next scheduled sampling round.
E-1FW	No data are included in this report for this location.	The location could not be sampled on 06/17/07 because it was dry.	Location will be checked again during next scheduled sampling round.
M-2E, TS-2E	No data are included in this report for these locations.	The locations could not be sampled on 06/15/07 because they were dry.	Locations will be checked again during next scheduled sampling round.
MCA-5	No data are included in this report for this location.	The location could not be sampled on 06/20/07 because it was dry.	Location will be checked again during next scheduled sampling round.
MT-2, MT-4	No data are included in this report for these locations.	MT-3 was sampled on 10/26/06. Only one location of MT-2, MT-3, and MT-4 needs to be sampled.	None
TSCA-6, TSWB-6	No data are included in this report for these locations.	The locations could not be sampled because they were dry.	Locations will be checked again during next scheduled sampling round.

Table 6.2-1
Number of Results above Standards or Screening Levels
for Groundwater and Surface Water,
October 19–November 8, 2006, PME

Sample Origin	Metals	General Inorganic	Organic	Radioactivity
Surface Water	3	1	2	0
Alluvial Groundwater	4	11	0	0
Intermediate Groundwater	2	5	1	1
Regional Groundwater	1	1	0	0

Note: Multiple detections of a particular constituent at a location are counted as one result.

Table 6.2-2
Number of Results above Standards or Screening Levels
for Groundwater and Surface Water,
February 26–March 18, 2007, PME

Sample Origin	Metals	General Inorganic	Organic	Radioactivity
Surface Water	3	0	0	0
Alluvial Groundwater	5	8	1	0
Intermediate Groundwater	3	6	1	0
Regional Groundwater	1	1	0	0

Note: Multiple detections of a particular constituent at a location are counted as one result.

Table 6.2-3
Number of Results above Standards or Screening Levels
for Groundwater and Surface Water,
June 4–June 24, 2007, PME

Sample Origin	Metals	General Inorganic	Organic	Radioactivity
Surface Water	2	0	6	0
Alluvial Groundwater	8	10	0	0
Intermediate Groundwater	0	5	1	0
Regional Groundwater	2	1	0	0

Note: Multiple detections of a particular constituent at a location are counted as one result.

Appendix A

Mortandad Watershed Conceptual Model

Mortandad Canyon Watershed Conceptual Model

Conceptual Model Element	Characteristic	Description
Surface Water	Flow	Mortandad Canyon and its tributaries are ephemeral. With the exception of gaging station E200, which measures flow created by discharge of treated effluent from the Technical Area (TA) 50 Radioactive Liquid Waste Treatment Facility (RLWTF), all other gaging stations measured flow only in response to precipitation. From 1995 to 2002, gage E200 measured flow 64% of the year, where the other gages (E202, E203, E204) measured no flow. Operating National Pollutant Discharge Elimination System (NPDES)-permitted outfalls associated with Mortandad Canyon include 051 associated with the TA-50 RLWTF; 03A-021 associated with the CMR Laboratory at TA-03; 03A-022 associated with the Sigma Building at TA-03; 03A-045 associated with the Rad Chem Laboratory at TA-48; 03A-160 associated with Antares Target Hall at TA-35; 03A-181 associated with a utility building at TA-55; and 04A-166 associated with water supply well Pajarito Mesa #5. Cañada del Buey within Los Alamos National Laboratory (the Laboratory) boundary is ephemeral, based on flow data from three gages: E218, E230, and E225. From 1995 to 2002, the number of days of flow per year ranged from 38 at the gage near TA-46 to 0 near MDA G. Cañada del Buey east of the Laboratory has effluent-supported flow from the Los Alamos County sewage treatment plant in White Rock, which discharges into Cañada del Buey about 2 mi upstream of its confluence with Mortandad Canyon and results in effluent-supported surface flow that regularly extends to the Rio Grande. Operational NPDES-permitted outfalls associated with Cañada del Buey include 13S associated with the TA-46 Sanitary Wastewater Systems Consolidation (SWSC) Plant (effluent is sampled at 13S but not discharged; all SWSC effluent is routed to TA-03) and 04A-118 associated with water supply well Pajarito Mesa #4.
	Quality	Key contaminants include americum-241, plutonium-238, plutonium-239/240, strontium-90, fluorine, nitrate, and perchlorate.
Springs	Name	No springs are present in the Mortandad Canyon.
	Quality	Not applicable

Mortandad Canyon Watershed Conceptual Model (continued)

Conceptual Model Element	Characteristic	Description
Alluvial Groundwater	Extent	Based on water levels observed in Mortandad Canyon alluvial wells, a saturated zone in the alluvium extends downstream from the TA-50 RLWTF outfall for approximately 2.2 mi. The easternmost extent of saturation in the alluvium is estimated near wells MCO-8 and MCO-8.2. In Cañada del Buey, nine alluvial wells were installed, but only two occasionally contain groundwater.
	Depth/Thickness	The saturated portion of the Mortandad Canyon alluvium is generally less than 10 ft thick, and there is considerable variation in saturated thickness depending on the amount of precipitation and runoff in any particular year. Groundwater flow velocity in the alluvium varies from about 60 ft/d in the upper canyon to about 7 ft/d in the lower canyon and has been estimated to be 30 to 40 ft/d between MCO-5 and MCO-8.2.
	Quality	Key contaminants include americum-241, gross alpha, gross beta, plutonium-238, plutonium-239/240, strontium-90, H-3, fluorine, nitrate, and perchlorate. Effluent releases have had a major impact on water quality.
Intermediate Groundwater	Extent/Hydrology	Perched groundwater was encountered during drilling of R-15 and MCOBT-4.4 in two different stratigraphic levels within the Cerros del Rio basalt. The lateral extent of these intermediate depth perched zones is unknown.
	Depth/Thickness	At MCOBT-4.4, a single screen set in a perched zone within the upper Puye Formation/Cerros del Rio basalt at a depth of 524 ft below ground surface (bgs). In R-15, perched groundwater was encountered at a depth of 646 ft bgs in the lower portion of the Cerros del Rio basalt.
	Quality	Key contaminants include nitrate, chromium, and perchlorate. Water quality shows the impact of historical effluent releases.

Mortandad Canyon Watershed Conceptual Model (continued)

Conceptual Model Element	Characteristic	Description
Regional Aquifer	Depth/Hydrology	The regional water table occurs within the Puye Formation in the Mortandad Canyon watershed. In Ten Site Canyon, approximately 3700 ft west of the confluence with Mortandad Canyon, the regional aquifer was encountered at a depth of 1182 ft in well R-14. In Test Well 8, located in Mortandad Canyon approximately 1300 ft west of the confluence with Ten Site Canyon, the regional aquifer occurs at a depth of 994 ft. The regional aquifer was encountered at a depth of 964 ft in R-15, located in Mortandad Canyon approximately 2000 ft east of the confluence with Ten Site Canyon. In well R-13, located approximately 5800 ft east-southeast of R-15, the regional aquifer was encountered at a depth of 833 ft. Flow in the regional aquifer is generally west to east with some deviation due to pumping the Pajarito Mesa well field. However, the flow tends to come back toward the east due to pumping of other wells. Average flow velocity for the regional aquifer in the vicinity of Mortandad Canyon is estimated to be about 95 ft/yr.
	Quality	Wells R-13 and R-14 have not shown contamination in the regional aquifer during drilling and/or subsequent characterization sampling. Key contaminants include perchlorate in well R-15.
Contaminants	Potential Sources	A description of potential release sites (PRSs) in the Mortandad watershed is provided in Work Plan for Mortandad Canyon. The canyon passes through or is adjacent to current Laboratory TA-03, 05, 35, 46, 48, 50, 51, 52, 54, 55, 59, 60, and 63. PRSs in Cañada del Buey are provided in the "Work Plan for Sandia Canyon and Cañada del Buey." Cañada del Buey has been a buffer zone for surface and subsurface material disposal areas at TA-54 and for effluent disposal, mostly from former TA-04. It also received discharges from TA-46, -51, and -52. Outfall discharges into Mortandad Canyon are described in the "Work Plan for Mortandad Canyon." Mortandad Canyon and its tributaries have received effluent from the Laboratory since the early 1950s. Outfall discharges into the Cañada del Buey drainage are described in the "Work Plan for Sandia Canyon and Cañada del Buey." Cañada del Buey received effluent from the Laboratory from the 1950s to the 1990s.
