

A. DEADLINES AND MILESTONES

October 22, 2007	Supplemental Information Submittal to EPA
October 26, 2007	wSAL Exceedance Report submittal, EPA and NMED
November 28, 2007	wSAL Exceedance Report submittal, EPA and NMED
November 29, 2007	Quarterly Status Report Q3 submittal, EPA and NMED
December 20, 2007	Supplemental Information Submittal to EPA
December 21, 2007	wSAL Exceedance Report submittal, EPA and NMED

B. PROGRESS MADE IN MEETING OTHER DEADLINES & MILESTONES

Details of the sampling status for the fourth quarter (Q4) of 2007 are provided in Table 1, *2007 SMA Monitoring Status*. Monitoring is on-going at 162 Site Monitoring Areas (SMAs) in accordance with the detailed sampling plans presented in Attachment 1, Part B, of the 2007 *Storm Water Pollution Prevention Plan for SWMUs and AOCs*, LA-UR-07-1789 (2007 SWMU/SWP). The watershed-scale sampling status for Q4 of 2007 is detailed in Table 2, *2007 Watershed-Scale Monitoring Status*.

Highlights of FFCA activities in Q4 of 2007 include

- ✓ 14 storm water monitoring samples collected at 14 SMAs;
- ✓ 7 storm water runoff sample collected at 7 watershed gage stations;
- ✓ wSAL exceedance inspections at 94 SMAs;
- ✓ ~250 Annual Site Comprehensive Evaluations were completed during Q4; and,
- ✓ Comments provided on the NMED November, 2007 Draft §305(b) Water Quality Monitoring and Assessment Report: Assessment Protocol.

On July 26, 2007 EPA Region 6 approved the 2007 SWMU/SWP submitted by DOE/LANL as required by the FFCA. As a result of that approval, LANL implemented the approved changes effective August 2007.

C. CORRECTIVE ACTIONS TAKEN TO ADDRESS wSAL EXCEEDANCES

The FFCA at paragraph 1|24 requires DOE to provide a quarterly status report on corrective actions taken to address wSAL exceedances. Specifically, the FFCA requires DOE to review data from storm water monitoring conducted at the SMAs. Where results are above water screening action levels (wSAL), LANL is required to conduct an investigation to determine the source within 30 days of receipt of the data (this report reflects data received from October 1 through December 31, 2007), and evaluate BMPs in accordance with the requirements imposed by the FFCA to determine if corrective action is required. For purposes of the FFCA, corrective action may include: install, re-examine, repair, modify BMPs, or source identification to control or eliminate the source or migration of pollutants or contaminants. The reported wSAL exceedances observed at SMAs in Q4 are summarized in Section C1.

OVERALL PROGRESS

- ★ *STORM WATER MONITORING AT 162 SMAS WAS ON-GOING DURING THE 4TH QUARTER OF 2007.*
- ★ *21 STORM WATER SAMPLES WERE COLLECTED DURING 4TH QUARTER.*
- ★ *~250 SITE INSPECTIONS WERE PERFORMED DURING 4TH QUARTER.*
- ★ *~430 ANALYTICAL SAMPLES WERE COLLECTED FROM 160 STATIONS OVER THE CY 2007 MONITORING PERIOD.*
- ★ *SUPPLEMENTAL INFORMATION FOR THE INDIVIDUAL PERMIT APPLICATION COVERING 283 SITES WAS PROVIDED TO EPA IN Q4.*

In addition to conducting the required Q4 SMA inspections (Section C2), the Laboratory is developing plan(s) for engineered controls installation (Section C3) and statistical methods for source identification (Section C4).

C1. wSAL EXCEEDANCES OBSERVED AT SMAS

For the Q4 (October through December) monitoring periods, there were 95 SMAs where wSAL exceedances were observed based on analytical data received during Q4. Canyon systems associated with the Q4 wSAL exceedances include Ancho, Bayo, Canada del Buey, Chaquehui, Canyon de Valle, Los Alamos, Mortandad, Pajarito, Pueblo, Rendija, Sandia, and Water.

C2. wSAL EXCEEDANCE SMA INSPECTIONS

The Laboratory performed visual site inspections at each SMA where wSAL exceedances were reported. The wSAL exceedance inspections include the following items.

- Comparing existing data to appropriate wSAL;
- Inspecting the condition of existing structural BMPs to determine whether maintenance is required;
- Inspecting for visual evidence of: storm water runoff; excessive erosion; non-storm water discharges;
- Appraisal of whether existing BMPs are adequate for sediment control and erosion control at the Site, and recommendations for additional BMP installations; and
- Installing new controls where evidence of flow or sediment migration is occurring.

During Q4, LANL conducted inspections at 94 SMAs in response to reported wSAL exceedances from previous sampled events (typically Q3 events). Details of the inspections and actions within the related SMAs are provided in Table 3, 2007 wSAL Exceedances and Corrective Action Status, and further discussed in Section D2.

C3. USE OF STATISTICS TO IDENTIFY PRIORITY SMAS FOR ENHANCED CONTROLS

Total contaminant concentrations greater than wSAL values can be found in high turbidity runoff samples. To develop efficient and proactive BMPs, the Laboratory must determine if the contaminant concentrations are due to Laboratory operations or due to natural or background sources. Local soils, geology, and weather patterns combine to produce naturally elevated and highly variable sediment loads, whether in storm water runoff from SMA/Sites, natural runoff (hillslope processes), or receiving waters (channel processes).

To aid management decisions, it is important to identify the presence and magnitude of these background effects on water quality so that point and non-point sources that need to be managed may be distinguished from natural processes that cannot be controlled. An analysis of monitoring data that incorporates background contributions is necessary to prioritize placement of enhanced controls, as well as track water quality changes over time at areas that are subject to monitoring and corrective action.

In response to this need, the Laboratory is developing a methodology to statistically characterize background conditions for metals and radionuclides in storm flow. Background conditions are those attributable only to non-Laboratory sources. Statistical correlations between total contaminant concentrations and suspended sediment concentrations (SSC) or surrogate (suspended aluminum) concentrations are established using sample results from locations upstream of and/or unaffected by Laboratory operations. Once the statistical associations are established, background ranges of metals or radionuclides can be predicted for a water sample in which the suspended solids (or

surrogate) concentration is known. The statistical relationships allow us to account for (normalize) the amount of background metal concentrations in the water samples and, in turn, identify possible Laboratory impacts.

C4. COMMENTS PROVIDED FOR ASSESSMENT METHODS AND STANDARDS

Comments on assessment methodologies and applicable standards were formally provided in the November, 2007 Draft §305(B) Water Quality Monitoring and Assessment Report: Assessment Protocol public comment period. The comments provided focused on two significant areas, the application of chronic water quality criteria to water bodies that only flow during precipitation events and the consideration of background concentrations in the assessment of water quality.

D. DESCRIPTION OF MATTERS RELEVANT TO STATUS OF COMPLIANCE

D1. VISUAL MONITORING AND SAMPLING ACTIVITIES

Visual monitoring of the collected storm water monitoring samples is conducted pursuant to the MSGP under EPA's approved 2007 SMWU/SWP^{PP}P at FFCA gage stations and SMA samplers. The Facility is required to obtain four (4) monitoring samples on an annual basis (i.e., on or before December 31, 2007) and to visually examine these samples at the time of collection. Quarterly monitoring is not required under the MSGP because the Laboratory has a general waiver that allows collection of four samples annually due to weather conditions that do not allow for sampling to be spaced evenly during the year (§ 5.3.1). Four annual samples are also authorized under the FFCA. In addition, the majority of the Sites are located in areas that are unstaffed, inactive, and cannot be feasibly reached within 30 minutes of a qualifying storm event. 'No flow' certifications are prepared and filed on a quarterly basis for those stations that did not have a qualifying storm event and thus were unable to collect a sample (i.e., insufficient flow to produce a discharge in volumes large enough to allow sample collection).

The majority of the SMAs are located in areas that are unstaffed, inactive, and cannot be feasibly reached within minutes of a qualifying storm event. Conducting a visual observation of a collected sample is part of the standard sampling procedure and only in rare cases are these observations not recorded upon sample collection. Due to the geographical challenges associated with this program, these visual observations are not always conducted within one hour of the sampled event.

During Q4, a total of 21 analytical monitoring samples and 70 visual observation samples were collected at the active monitoring stations. Visual monitoring and sample collection efforts were completed at 66 SMA stations (see Table 1) and 11 watershed-scale gage stations (see Table 2) during 2007.

D2. BMP INSPECTION AND MAINTENANCE

During the fourth quarter, LANL conducted wSAL inspections at 94 SMAs where wSAL exceedances were reported, per the requirements of the 2007 SWMU/SWP^{PP}P (see Section C). Details of the Q4 wSAL inspections and actions are provided in Table 3, 2007 wSAL Exceedances and Corrective Action Status. As a result of the wSAL inspections, new SMA controls were installed at several sites. In some cases, maintenance could not be performed due to adverse winter weather conditions.

Some of the challenges in the fourth quarter, relating to the inspection and maintenance program, were observed in areas where SMAs were potentially affected by other surrounding stakeholders. There are many of the historical sites located on or near private, county, and other federal lands. Controlling access to these areas is difficult and coordinating response actions with multiple parties requires a great deal of coordination. Non-structural BMPs, in the form of coordination and training of

non-Laboratory entities will be a priority as we move towards and/or demonstrate permanent solutions in these areas.

D3. NPDES INDIVIDUAL PERMIT APPLICATION ACTIVITIES

LANL continued progress in assessing Clean Water Act (CWA) criteria to determine applicability for inclusion of areas associated with historical sites in the Facility's Storm Water Individual Permit. CWA criteria evaluated include: identification of point source discharges; determination of exposure to storm water; review of discharge termination; and assessment of the presence of significant industrial materials. CWA criteria assessments and comprehensive field evaluations were completed at approximately 500 historical sites during Q3. These areas were assessed or re-assessed for erosion potential during these field evaluations.

Formal documentation packages of the activities described above and a listing of associated historical sites recommended for permitting were submitted to the EPA during Q4. The submission detailed findings for 283 Sites recommended for inclusion under the individual permit. The documentation packages included site descriptions, revised/updated erosion potential evaluations, current site photographs, and ultimately the recommendation for permitting.

The Laboratory also completed and submitted a "reasonable potential" evaluation of storm water monitoring data collected over the period February 2004 through June 2007 for sites recommended for inclusion in the individual permit. This document identified 9 pollutants of concern that exhibit reasonable potential associated with Sites recommended for permitting.
